

DSL HIGH SPEED INTERNET SERVICE

If you plan to have **DSL high speed internet service** installed on the same line that your security system is on or if you already have this service in use you will need to install a **DSL Alarm Filter**. Without this filter your security system may not be able to communicate to the central monitoring station 100% of the time. At the time of your security analysis be sure and mention that you have DSL on your existing telephone line so a filter can be installed at the time of installation. If you have had DSL service installed after your security system was put in you need to contact us to make arrangements to install a DSL filter.
